GCTS is committed to designing accurate testing systems by integrating innovative software engineering with advanced hardware. GCTS systems perform at the highest levels of reliability, providing efficient systems that satisfy customer needs and expectations.

| **STX-2000** |
| Extra Large Scale / Stress-Path Soil Triaxial System |

- Electro-Hydraulic digital servo control
- 1,000 mm Specimen Diameter
- Axial loads up to 3,000 kN
- Cell Pressures up to 3,000 kPa
- Direct servo control of stress, strain (axial, radial, volumetric, etc.) or any other calculated variable
- Dynamic compaction frame with 200 kN load capacity and frequencies from 0 to 100 Hz

**DESCRIPTION**

The STX-2000 triaxial testing system is intended for performing tests on soils with large particle sizes such as rock backfills and gravelly soils. The triaxial cell accepts 1,000 mm diameter samples with heights up to 2,000 mm. This system also provides the necessary versatility to automatically perform conventional triaxial tests as well as advanced procedures such as stress or strain path. In addition the STX-2000 has the capability of performing dynamic triaxial tests.
The standard STX-2000 system includes all the necessary hardware and software to automatically perform all triaxial stages including saturation, consolidation, and easily created cyclic and static customized test procedures. It allows creation of an unlimited variety of waveforms including user-generated profiles such as a digitized earthquake record or other vibration records. The program helps the user select the proper testing parameters and provides the necessary information required to automatically execute the desired test.

The Graphical User Interface helps minimize learning time and enables laboratory personnel to conduct more complex, but realistic, testing programs at substantially lower operating cost and also with minimal operator error.

This system includes a load frame mounted on a heavy duty platform. These frames can be configured with different flow capacity servo valves to obtain the required cyclic amplitudes.

The triaxial cell included with the STX-2000 system is constructed of stainless steel. The standard unit features a composite see-through Plexiglas cell wall reinforced with anodized aluminum rings. All the standard GCTS triaxial cells can accommodate smaller diameter specimens using optional platens. These triaxial cells accept specimens with a length of 2 times the diameter. Also included is a three part split sample compaction mold to form 1,000 mm diameter by 2,000 mm high specimens made of anodized aluminum.

The STX-2000 system includes a pressure control panel complete with servo control of the cell and back pressure, 40 liter fluid capacity, venturi vacuum pump, volume change device, automatic ball valve, flow indicators, etc. making this panel very convenient and easy to operate. A Pressure gauge provides visual verification of confining and pore pressures. Convenient “quick-connect” fittings allow for easy connection of pressure lines and filling/drainning the fluid reservoirs. Each pressure controller allows for the servo control of the confining and back pressure as a function of pressure or any other measured or calculated test parameter. With both pressure controllers, advance tests such as stress/strain path, Ko, multi-stage triaxial, permeability, etc. can be easily performed.

The specimen accessories include optional fiber reinforced non-woven rubber membranes specifically designed for durability and low resistance to stretching (low modulus of elasticity). The specimen platens come with quick connect coupling for rigid connection to specimen top to allow for stress reversal condition to be applied during testing.

The STX-2000 is operated with our fully integrated SCON-3000 digital signal conditioning/controller and the state-of-the-art CATS-TRX-SOIL, Windows XP, Vista or 7 software. Conducting Triaxial tests have been greatly simplified by the incorporation of direct user programming of test calculated parameters in the units of interest (stress, strain, etc.) based on the specimen dimensions. Up to 20 test parameters are automatically defined and corrected taking into account such things as piston uplift force from confining pressure application and changes in specimen area during the test. These parameters are calculated in real time and are available for display, graph and/or control. In addition, CATS software allows you to define user defined parameters to obtain multiple sensor averages or corrections as a function of other inputs. Using calculated test parameters directly eliminates complex and lengthy pre-calculations to design test programs. This allows the user to concentrate on the material behavior rather than on the electronics and equipment operation.

The embedded microprocessor is capable of performing all test functions even if the Windows computer crashes. It provides automatic dynamic control mode switching between any connected transducer or calculated parameter (“bump-less transfer”). This controller also conditions all transducers used for triaxial testing and provides real time linearization of any input using high-order polynomials. This digital controller is capable of updating the control loop at up to 10 kHz required to control the loads for high frequency dynamic tests. The SCON-3000 has several adaptive compensation techniques to improve the control precision without user intervention. Controlling the actual axial stress (as opposed to the axial load) and use of the Peak and Valley compensation ensures the precision of the programmed waveform amplitude even after the specimen undergoes significant deformations or stiffness degradation. This is an important feature in order to maintain the desired cyclic amplitudes throughout the entire test.
Our system includes a 32,000 per second sampling rate with 24-bit resolution and “sample-and-hold” Digital-to-Analog (A/D) Converter. The sample-and-hold ensures that the converted values from all attached sensors (load cells, deformation, etc.) represent a single instant in time eliminating any data skew from delays in the A/D converter. GCTS hardware-software interface includes both an analog anti-alias filter for high frequencies and a digital filter for lower frequencies. This configuration produces a very stable and precise signal measurement and control system as required to perform dynamic triaxial tests.

Any desired unit can be used for display or report test parameters and even allowing combining different unit systems. GCTS software also offers compatibility with network systems for monitoring or sending your test data directly to any computer connected to your network. Using a Windows network system in your lab facilitates transferring of your test data directly into other Windows programs such as Word or Excel for report generation as well as to easily backup your important test results.

Together with GCTS excellent support from our highly qualified and experienced staff, we are sure to provide the best option and price-performance value.

**SPECIFICATIONS**

Systems built to customer specifications. Please see enclosed quotation with detailed technical specifications.

**WARRANTY**

Standard one (1) year parts and labor. Optional extended warranty available.

**STX-2000 Autolocking Triaxial Cell:** An automatic hydraulic lift for the triaxial cell top is included with this system for fast and easy specimen preparation as compared to conventional triaxial cells. Fast sealing of the cell is achieved with the push of a single button. The cell top is automatically lowered to seal all of the triaxial cell sections. No bolts or other fasteners are used to seal the triaxial cell, resulting in more time dedicated to testing.
STX-2000 Specimen Preparation Steps

1. **Dynamic Compaction**
   - Three-Part Specimen Compaction Mold
   - Dynamic Compaction Load Frame with 200 kN actuator, 0-100 Hz

2. **Triaxial Cell Assembly**
   - Triaxial Cell Assembly Winch
   - Triaxial Cell Section
   - Triaxial Cell
   - Autolock triaxial cell top

3. **Specimen Weighing**
   - Specimen

4. **Triaxial Testing**
   - Autolock triaxial cell top
   - Triaxial Cell Section
   - Triaxial Cell
   - Specimen
